Topic : Maverick Feedback 360

2026

Mavericks
Designathon

Problem Statement

Current Pain Points

- Low feedback completion rates
- Manual follow-ups & tracking
- No real-time analytics
- No correlation between training & performance

The Problem

Organizations lack a centralized, intelligent system to measure training effectiveness. Feedback collection is manual, delayed, and lacks actionable insights.

Why It Matters

- Training investments are high but ROI is unclear
- Poor feedback leads to ineffective training programs
- Delayed insights impact business productivity
- No data-driven decision making

Who Is Impacted

- Mavericks (Employees)
- Supervisors / Managers
- L&D Teams
- Senior Leadership

Proposed Solution

An AI-powered feedback & analytics platform that automates the entire training feedback lifecycle and delivers real-time insights, predictions, and recommendations.

Key Feature 1

- AI Smart Feedback Collection
- Auto-triggered feedback after training
- Auto-fill & smart suggestions

Key Feature 2

- AI Sentiment & Insight Engine
- Analyzes feedback using NLP
- Detects sentiment, themes, issues

Key Feature 3

- Smart Reminder & Nudging System
- AI-personalized reminders
- Behavioral nudging to increase completion

Key Feature 4

- Performance & Effectiveness Tracking With AI generated score
- Supervisor evaluation after 3 months

Tech Stack

Programming Languages

Python

JavaScript / TypeScript

Databases

PostgreSQL

MongoDB

Gen AI Models / APIs

GPT-based models

NLP models for sentiment analysis

Frameworks

React (Frontend)

FastAPI / Node.js (Backend)

Cloud Services

AWS / Azure

Firebase (Notifications)

Other Tools

Docker

GitHub

Gen AI Use Cases

Describe the specific ways Generative AI is integrated into your application and the value it provides.

Use Case 1-Smart Feedback Assistant

Input: User feedback text

Output: Refined responses, suggestions

Enhancement: Improves quality of feedback

Use Case 2 — Sentiment Analysis Engine

Input: Feedback comments

Output: Sentiment + key themes

Enhancement: Converts raw text into insights

Use Case 3 — AI Recommendation Engine

Input: Training + performance data

Output: Training improvement suggestions

Enhancement: Enables data-driven decisions

UI/UX Wireframes

Include mockups or sketches of key screens and user flows created using tools such as Figma, Excalidraw, or similar.

Screen 1 — Maverick Dashboard

Screen 1 — Maverick Dashboard

This screen allows Mavericks to view assigned trainings, track progress, and submit feedback. It provides a centralized interface for managing all training-related activities.

Purpose in User Flow:

Acts as the entry point where users check pending feedback, submit responses, and interact with the AI assistant for guidance.

Screen 2 — Admin Dashboard

Screen 2 — Admin Analytics Dashboard

This screen provides L&D teams with real-time insights into training effectiveness, feedback trends, and performance metrics using AI-driven analytics.

Purpose in User Flow:

Used after feedback collection to monitor completion rates, analyze sentiment & trends, and take data-driven decisions.

DEVELOPMENT TIMELINE

Week-wise plan showing features to be delivered, aligned to the ~80% completion goal by the end of the programme.

Innovation & Differentiation

What Makes It Unique : Maverick Feedback 360 goes beyond traditional feedback tools by transforming raw feedback into predictive, actionable intelligence using AI. It not only captures feedback but closes the loop between training, performance, and business impact.

1

Differentiator 1 - End-to-End Intelligent Automation

Fully automated feedback lifecycle (trigger → reminder → closure)

Eliminates manual tracking and follow-ups

Ensures 75–80% completion compliance automatically

2

Differentiator 2 — AI-Powered Insight Engine

Converts unstructured feedback into sentiment, themes, and trends

Identifies hidden issues in training quality

Provides real-time actionable recommendations

3

Differentiator 3 — Training-to-Performance Mapping

Links training feedback with post-project performance (after 3 months)

Measures actual effectiveness, not just satisfaction

Enables data-backed ROI tracking for training programs

4

Differentiator 4 — Smart Nudging & Behavioral AI

AI-driven personalized reminders

Predicts likelihood of response and nudges accordingly

Reduces feedback fatigue while increasing participation

Gen AI Design Strategy

Rationale for using Generative AI, high-level prompt design, workflow architecture, and human-in-the-loop considerations.

1

Rationale for Gen AI

Gen AI enables:

- Understanding unstructured feedback
- Generating insights automatically
- Personalized user interaction

2

Prompt Design

- Structured prompts
- Context injection (user, training data)
- Controlled outputs

3

AI Workflow

Trigger → Process feedback → Analyze → Generate insights → Display

4

Human-in-the-Loop

- Admin validation
- Feedback review
- Override options

COST AWARENESS & OPTIMISATION

EXPECTED AI USAGE

Expected AI usage, cost-control techniques (prompt efficiency, limited API calls, rule-based fallbacks)

Prompt Efficiency

Short structured prompts
Token optimization

Limited API Calls

Trigger only when needed

Rule-Based Fallbacks

Use logic instead of AI where possible

Risks, Assumptions & Constraints

Key Risks

Low adoption

Data quality issues

AI bias

Assumptions

Users provide feedback

Data availability

Technical Constraints

API cost

Integration limits

Scope Boundaries

Training feedback system

Analytics & insights

AI recommendations

Success Metrics

How We Measure Success?

Our platform success is measured through quantifiable business and user impact metrics.

1

Time Saved

Reduction in manual follow-ups and tracking

Automated workflows reduce admin effort by 60–70%

Faster feedback cycle closure

2

Adoption

% of Mavericks and Supervisors actively using the platform

Target: $\geq 80\%$ active participation per cycle

Measured via login frequency & completion rates

Success Metrics

How We Measure Success?

Our platform success is measured through quantifiable business and user impact metrics.

3

Error Reduction

Standardized forms reduce inconsistent feedback

AI validation minimizes incorrect or incomplete inputs

Improves data accuracy for decision-making

4

Automation %

% of feedback lifecycle handled without manual intervention

Includes:

- Feedback triggering
- Reminders
- Analysis

Target: $\geq 75\%$ automation

5

Efficiency Gains

Faster decision-making through real-time dashboards

Reduced training inefficiencies

Improved productivity of L&D teams
