Problem Statement

Current Pain Points

- Pain point one describe the friction or inefficiency
- Pain point two describe the friction or inefficiency
- Pain point three describe the friction or inefficiency

The Problem

Clearly describe the problem being solved here. What is the core challenge or gap that exists today?

Why It Matters

Explain the significance of solving this problem the scale, urgency, or consequences of leaving it unaddressed.

Who Is Impacted

Describe the target users or stakeholders affected by this problem. Include relevant demographics, roles, or contexts.

Proposed Solution

Provide a high-level overview of your application and how it directly addresses the problem described.

Designathon

Key Feature 1

» Describe this feature and how it solves part of the problem.

Key Feature 2

» Describe this feature and how it solves part of the problem.

Key Feature 3

» Describe this feature and how it solves part of the problem.

Key Feature 4

» Describe this feature and how it solves part of the problem.

Tech Stack

Programming Languages

List the languages used (e.g. Python, JavaScript, TypeScript)

Frameworks

List the frameworks used (e.g. React, FastAPI, Node.js)

Databases

List the databases used (e.g. PostgreSQL, MongoDB, Firebase)

Cloud Services

List the cloud platforms and services (e.g. AWS, GCP, Azure)

Gen AI Models / APIs

List the Gen AI models and APIs used (e.g. GPT-4, Gemini, Claude)

Other Tools

List any additional tools (e.g. Docker, GitHub Actions, Figma)

Gen AI Use Cases

Describe the specific ways Generative AI is integrated into your application and the value it provides.

Use Case 1 — Name

Input: Describe what data or prompt is fed into the AI model.

Output: Describe what the AI generates or returns.

Enhancement: Explain how this improves the user experience or solution.

Use Case 2 — Name

Input: Describe what data or prompt is fed into the AI model.

Output: Describe what the AI generates or returns.

Enhancement: Explain how this improves the user experience or solution.

Use Case 3 — Name

Input: Describe what data or prompt is fed into the AI model.

Output: Describe what the AI generates or returns.

Enhancement: Explain how this improves the user experience or solution.

UI/UX Wireframes

Include mockups or sketches of key screens and user flows created using tools such as Figma, Excalidraw, or similar.

Screen 1 — Name

Brief description of this screen and its purpose in the user flow.

Screen 2 — Name

Brief description of this screen and its purpose in the user flow.

Add your Figma or Excalidraw wireframe images and describe the key user flows for each screen shown.

DEVELOPMENT TIMELINE

Week-wise plan showing features to be delivered, aligned to the ~80% completion goal by the end of the programme.

 Adjust the weekly milestones and feature deliverables to reflect your team's actual plan.

Innovation & Differentiation

What Makes It Unique: Describe the unique or creative aspects of your solution. What novel approach, combination of technologies, or user experience sets it apart?

1

Differentiator 1

Describe the advantage of your solution in this space.

2

Differentiator 2

Describe the advantage of your solution in this space.

3

Differentiator 3

Describe the advantage of your solution in this space.

4

Differentiator 4

Describe the advantage of your solution in this space.

Gen AI Design Strategy

Rationale for using Generative AI, high-level prompt design, workflow architecture, and human-in-the-loop considerations.

1

Rationale for Gen AI

Explain why Gen AI was chosen for this solution and what specific capabilities it brings that traditional approaches cannot provide.

2

Prompt Design

Describe the high-level approach to prompt engineering — structure, context injection, constraints, and output formatting strategies.

3

AI Workflow

Outline how the AI fits into the overall application workflow — where it is triggered, what it processes, and how results are used.

4

Human-in-the-Loop

Describe how human oversight is incorporated review steps, feedback mechanisms, fallback options, and safeguards against AI errors.

COST AWARENESS & OPTIMISATION

EXPECTED AI USAGE

Expected AI usage, cost-control techniques (prompt efficiency, limited API calls, rule-based fallbacks)

Prompt Efficiency

Optimising prompts to reduce token usage and cost per call

Limited API Calls

Controlling frequency and volume of API requests

Rule-Based Fallbacks

Using deterministic logic where AI is not required

Designathon

What Makes It Unique: Describe the unique or creative aspects of your solution. What novel approach, combination of technologies, or user experience sets it apart?

1

Time Saved

Explain how streamlined steps help teams finish tasks more quickly.

2

Adoptio

Track how widely the tool/solution is taken up and how smoothly people shift to using it.

Success Metrics

What Makes It Unique: Describe the unique or creative aspects of your solution. What novel approach, combination of technologies, or user experience sets it apart?

3

Error Reduction

Measure how often errors drop after the tool is introduced.

4

Automation %

Describe the share of tasks that now run on their own without manual help.

5

Efficiency

Gains

Describe how the solution raises efficiency in work and system use.
